They meticulously examine the historical record, demonstrating that the Earth's climate has always undergone periods of significant change, both natural and human-induced. They debunk the notion that carbon dioxide (CO<sub>2</sub>) is the primary driver of global warming, emphasizing that this vital gas is essential for plant growth and the overall health of our planet.

### **Unveiling the Missing Science**

The book's title, "The Missing Science," aptly captures its essence. Moore and Heller unveil a wealth of scientific observations and data that have been overlooked or suppressed in the mainstream climate change narrative. They provide evidence that the Earth's climate is far more complex than previously acknowledged and that factors such as solar activity, ocean currents, and cloud cover play significant roles in shaping it.

The authors present a comprehensive analysis of the Arctic and Antarctic ice caps, demonstrating that their melting rates are within historical norms and do not support the dire predictions of catastrophic sea-level rise. They further explore the impacts of human activities on the environment, acknowledging that while pollution and resource depletion are pressing issues, they must be addressed separately from the issue of climate change.

### **A Call for Balanced Decision-Making**

"Heaven and Earth" is more than just a scientific critique; it is a clarion call for balanced decision-making. Moore and Heller emphasize the need to base policy decisions on sound science rather than fear-based rhetoric.

They caution against hasty and costly measures that could have unintended consequences for our economy and society.

The book advocates for a multifaceted approach to environmental stewardship, one that recognizes the importance of both human well-being and the preservation of our natural resources. It calls for a shift in focus from reducing CO2 emissions to promoting sustainable practices that enhance the resilience of our planet and its ecosystems.
